In an examination of the characteristics of photoelectrons at room temperatures with the help of the Haynes-Shockley impulse method, an effect was noted in AgCl crystals subjected to a particular previous treatment, from which one can ascertain that it is caused by the wandering of defect electrons. An area appears through which a large number of photoelectrons pass. (Physics, TT, v. 8, no. 3) (over)

A new volumetric method for the determination of manganese is developed, which is based on the oxidation of the manganese with potassium bromate in the presence of concentrated phosphoric acid and on the reductometric titration of the resulting trivalent manganese with iron (II) solution or hydroquinone solution as standard liquid. The titration can be carried out potentiometrically. (Chemistry--Analytical, TT, v. 9, no. 9) (over)
